

Features and Use

- Retrofittable flip flow system from Binder+Co
- Dynamic excitation of screening panels made from highly wear-resistant polyurethane
- Clog-free screening due to self-cleaning
- Retrofittable with circular and linear vibratory screens, also with third-party makes
- For use with bulk materials difficult to screen

Operation

The screening panels are mounted on tiltable longitudinal supports. These supports are equipped with weights on one side. During operation of the screens, the screening panels tighten and relax on the basis of the principle of inertia. In this way a whip-lash effect is brought about which enables clog-free screening.
